

Cannabis Conundrum Info Sheet.

CANNABIS CONUNDRUM:

We have been fed, ad nauseum, that Cannabis is just a plant and relatively harmless, right? If you say it loud and long enough, you might believe it? We were told by the consensus manufacturing #420 activists and their propogandist promoters, the evidence ignoring media, that if we legalize this stuff ALL will be well – on every front!

No more crime! Health will increase! Taxes and surplus revenue will be raised, well, so the cornucopian pronouncements went. Well, a chaotic conundrum has inevitably arisen. All promises have not only failed, but greater harms are being done to even more of our community, with the permission modelling pushing the drug onto a now ill-informed culture and clueless Gen Next.

Here you will find an ever growing list of data that is but a fraction of the evidence-based scientific research that reveals the social, mental, health, genetic, environment and community harms of this 'harmless plant!' **If facts and evidence matter in making informed best-practice decisions, then this is your space!**

Busting the Myth That
Cannabis Doesn't Kill

CANNABIS AS MEDICINE?

It is utterly mind-blowing that people have no idea that Cannabis has been part of the medical prescription landscape for over 20 years. That's right T. G. A (Therapeutic Goods Administration) trialed and approved cannabis-based medicines have been available as an option to alleviate, if only in small ways, some of the symptoms of a couple of diseases or help with recovery from treatment. However, the claims of this plant being a 'miracle cure' for just about everything, have existed for of 100 years... yet in no credible and advanced research has any of the properties of the Cannabis plant 'cured' anything, ever!

There is no argument that some components of this incredibly complex plant can have some therapeutic benefit, be it ever so small, but deriving such from the plant without co-opting some of the more detrimental components has proven incredibly difficult. On top of that, the evidence emerging from latest science, sees that some of these therapies, do more harm than good, with the temporary alleviating of a symptom on one hand, and incurring long term genetic harm on the other! **Again, if facts and evidence matter to your best-practice health care, then this is the space for you. Make informed decisions based on science, and not quackery!**
